This sequence corresponds to the human gravin polypeptide, and represents a polypeptide of the invention. The polypeptides are fragments capable of binding to type II regulatory subunit of cAMP-dependent protein kinase (PKA). Gravin is a kinase anchoring protein that binds to type II regulatory subunits of PKA and protein kinase C (PKC). Gravin is also an antigen of the autoimmune disease Myasthenia gravis (MG), where a patient develops antibodies against their own nicotinic acetylcholine receptors. The polypeptides are useful for providing analogues of gravin in the study of the modulation (e.g. blocking, inhibiting and stimulating) of interactions between gravin and kinase. The peptides are involved in the modulation of gravin-kinase interactions. New polypeptide fragments of protein kinase binding protein gravin are useful for the study of modulation of action between gravin and Example 1; Column 19-32; 32pp; English. ```
The present sequence is the protein sequence of human gravin. Gravin is an A-Kinase anchoring protein (ARAP) which is involved in the localisation of cAMP dependent protein kinase A (PRA) via interactions between the RII binding region and the PRA regulatory subunit RII. Gravin is also an antigen found in myasthenia gravis sufferers, and it is thought that antibodies to it may be useful in modulating the binding of PKA, and thus ald in the treatment of the disease. The gravin coding sequence was isolated by first screening a human umbilical vein endothelial cell cDNA library with serum from a myasthenia gravis patient, and then searching a human heart cDNA library for sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotides useful for detecting gravin in patients suffering from Myasthenia gravis encodes cAMP-dependent protein kinase-binding polypeptide and protein kinase.C-binding polypeptide of gravin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
```

This invention relates to a polypeptide which induces chromatin agregation. The polypeptide is a fragment of the human Acinus protein. Included in the invention is a nucleotide sequence encoding the polypeptide, antisense oligonucleotides, antibodies recognising the polypeptide, uncleotide sequence, and sense or antisense containing the polypeptide sequence, and sense or antisense oligonucleotides. Also included in the invention is a method for screening compounds for their activity as chromatin aggregation in the coll nucleus without inducing DNA fragmentation. The polypeptide can be used in the investigation and treatment of diseases in which apoptosis is implicated, including AIDS, Alzheimer's diseases, Parkinson's disease, cardiac or brain infarction, herpes or adenovirus infection, diabetes and viral hepatitis. The present sequence represents the human Acinus protein. 78; A novel polypeptide which induces chromatin aggregation but is not involved in DNA fragmentation used for the regulation of apoptosis and screening of potential apoptosis inhibitors 329 PRRKAKESKTREYYEKQFPEIRKQREQQERFQRVGQRGAGLSATIARSEHEISEIIDGLS 388 389 EQENNEKQMRQLSVIPPMMFDAEQRRVKFINMNGLMEDPMKVYKDRQFMNVWTDHEKEIF 448 -----sllpp----elels 199 449 KDKFIQHPKNFGLIASYLERKSVPDCVLYYYLTKKNENYKALVRRNYGKRRGRNQQIARP 508 SQEEKVEEKEE-----DKAEKTEKKEEEKKDEEEKDEKE---DSKENTKEKDKID 555 581; Gaps DB 21; Length 1341; Indels Query Match 2.5%; Score 317.5; DB 21; Best Local Similarity 19.8%; Pred. chromosome

This sequence is encoded by the acute lymphoblastic leukemia (ALL-1) gene of chromosome 11. The ALL-1 gene was isolated by translocation breakpoint mapping. Fragments of the ALL-1 cDNA may be used to identify chromosomal abnormalities within the ALL-1 gene. These fragments may be used in the treatment and diagnosis of human leukemias auch as acute lymphocytic, myelomonocytic, mnoncytic and myelogenous leukemia. ALL-1 protein shows three regions of homology to the Drosophila trithorax protein. These regions of homology to the Drosophila trithorax protein. These regions show 64%, 66% and 82% similarity respectively, to the Drosophila gene. The third region of homology constitutes the extreme C-terminus of the two proteins, both proteins end in an identical sequence. The first homology region is cysteine-rich and contains sequence motifs analogous to four zinc finger domains (3-6) within the trithorax gene. The second region of homology is also cysteine-rich and corresponds to zinc fingers 7 and 8 the Drosophila gene. The multiple conserved cysteines and of the multiple conserved cysteines and thistidines at the 3' end of the motifs allow two or three arrangements of the putative fingers. The structure of these cysteine-rich domains appears to be unique to the trithorax and ALL-1 genes. Disclosure; Page 29-50; 90pp; English. 3910 AA; Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                  The ALL-1 cDNA was obtained from a series of overlapping clones spanning 14.7 kb, isolated by screening a human fibroblast library and a K562 library. The sequence revealed a single, long ORF predicting a protein of approx. 4000 amino acids. The predicted amino acid sequence includes regions of homology with the Drosophila trithorax gene which contain zinc finger domains. The multiple conserved cysteines and histidines at the 3' end of the motifs allow two or three arrangements of the putative fingers. The ALL-1 gene on chromosome 11 is involved in a series of chromosomal translocations which are associated with certain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence (AAR92100) of full-length human retinoblastoma (Rb) protein-interacting zinc finger (RIZ) allele D283 was deduced from a cDNA sequence (AAT18020) cloned from human foetal brain cDNA. RIZ protein is present primarily in the cell nucleus. It acts as a cell differentiation factor, and can modulate cell function by binding to Rb, which is involved in regulating cell proliferation. RIZ on also act to regulate transcription. RIZ or its active fragments (see AAR92106) can be obtd. by recombinant DNA methods, and used to identify agents that modulate cell proliferation and thereby treat tumour growth (esp. neuroblastoma or melanoma) or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        193 sepdftsanmrdsaegpkedeekpsasalegpatlg---evasgevppelatpapawepg 249

The present sequence is a mutant human retinoblastoma (Rb)-interacting zinc finger (RIZ) protein, encoded by allele D283. RIZ is a nuclear phosphoprotein that acts as a cell differentiation factor. RIZ can modulate cell growth by binding to Rb protein, which is involved in regulating cell proliferation. In addition, RIZ can act to regulate transcription. RIZ functions to maintain cells in the G1 phase of the cell cycle, by interacting with Rb through the cr2 domain of RIZ. RIZ protein is a PR domain protein and is present primarily in the cell cycles. RIZ gene mutations may be implicated in various cancers such a melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may be used in gene therapy for these disorders. Since RIZ protein is implicated in cell cycle arrest, inhibition of RIZ activity may be useful in neurodegenerative disorder therapy e.g. for Parkinson's, Huntingdon's or Alzheimer's disorder therapy is or motor neurone disorders, or cardiac disorders e.g. for heart disease, where the ability to induce neural/ cardiac tissue proliferation would be useful. The human RIZ gene is located on chromosome lp36. The RIZ D283 allele is thought to occur two times more frequently in the human population than the RIZ B283 allele (AAA60123 and AAB1213).
                                                                                                                                                                                                                                                                                                                                New PR domain peptides comprising amino acid sequences from, for example retinoblastoma-interacting zinc finger, or egl-43 proteins, for regulating gene transcription and controlling cell proliferation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: the present sequence is not shown in the specification but is derived from the human RIZ allele D283 sequence given in Figure 9 (see

X	Ident	identification of a compound having properties characteristic of CBP

Identification of a cpd. (I) which inhibits and/or promotes activation of CAMP and mitogen responsive genes comprises monitoring expression of a reporter in response to (I), relative to expression of reporter in the absence of (I), where exposure of (I) is performed in the presence of (I), where exposure of (I) is performed in the presence of (I), a signal dependent transcription; (2) a polypeptide comprising at least maino acid residues 461-661 of this sequence (ARRY9054); and (3) a reporter construct comprising a reporter gene under the control of a signal dependent transcription factor. The method can be used to identify a compound which has the binding and/or activation properties of CREB binding protein or the transcription activation characteristic of a signal dependent which inhibits and/or promotes the activation of cAMP and mitogen Claim 1; Page 32-39; 46pp; English transcription factor responsive genes

The present sequence is the mouse nuclear CREB binding protein (CBP). CREB is the cyclic AMP (CAMP) response element binding protein. CBP cooperates with upstream activators which are involved in transcription activation. Signal transduction by cAMP appears to be involved in the aetiology of non-insulin dependent diabetes mellitus (NIDDM), and so inhibition of cAMP signal transduction, which would lead to gene transcription inhibition, may be a possible target for therapy. To identify possible cAMP activation inhibitors, the expression of a reporter construct comprising a GAM response element operatively linked to a reporter gene can be monitored. Any test compounds which reduce reporter gene expression would be a cAMP activation inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   plnggdsst------pnlpkga----astsgptppasgalnpgagkgvg 159

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Huntingdon's or Alzheimer's disease, paralysis or motor neurone disorders, or cardiac disorders e.g. for heart disease, where the ability to induce neural/ cardiac tissue proliferation would be useful. The human RIZ gene is located on chromosome 1p36. The RIZ D283 allele is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           finger (RIZ) protein, encoded by allele D283. RIZ is a nuclear phosphoprotein that acts as a cell differentiation factor. RIZ can modulate cell growth by binding to Rb protein, which is involved in regulating cell proliferation. In addition, RIZ can act to regulate transcription. RIZ functions to maintain cells in the G1 phase of the cell cycle, by interacting with Rb through the cr2 domain of RIZ. RIZ protein is a PR domain protein and is present primarily in the cell nucleus. RIZ gene mutations may be implicated in various cancers such as melanoma, neuroblastoma, leukaemia and breast cancer, and so the RIZ gene may be used in gene therapy for these disorders. Since RIZ protein is implicated in cell cycle arrest, inhibition of RIZ activity may be useful in neurodegenerative disorder therapy e.g. for Parkinson's,
                                                                                                                                                                                                                                                                  Human; Rb-interacting zinc finger; RIZ; retinoblastoma; heart disease; cell proliferation; cell differentiation; tissue repair; transcription regulator; breast cancer; gene therapy; melanoma; neuroblastoma; leukaemia; parkinson's disease; Huntingdon's disease; Alzheimer's disease; paralysis; motor neurone disorder; chromosome 1p36.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for

SES	Cellular transcriptional factor CBP.
K W	Cellular transcriptional factor; CBP; P/CAF; human; transcription;

```
This polypeptide sequence comprises CBP, a global transcriptional coactivator that is involved in the regulation of various DNA-binding transcriptional factors. The invention relates to a novel human p300/CBP associated cofactor. P/CAF (see AAW40052), that modulates transcription through binding to p300 and CBP (see AAW40058). The region (see AAW40060) of CBP that binds to P/CAF is claimed. The invention provides methods of screening for compounds that inhibit or stimulate the transcription modulating and histone acetyltransferase activity of P/CAF and p300/CBP. Inhibitors can be used e.g. to inhibit thy TAF-mediated than transcription in the treatment of HIV infection. Stimulators can be used e.g. to inhibit the cation factor MyoD to promote muscle differentiation factor MyoD to promote muscle differentiation. The products can also be used to inhibit the cell cycle progression inducing effect of an occoprotein which binds p300/CBP in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           65 LRRRPSLLSEFHPGSDRPQERRTSYEPFHPG--PSPVDHDSLESKRPRLEQVSDSHF--- 119
